DIAGNOSTIC TOOL

Computer check report

A plain-language summary first. Hardware and technical details follow. This PDF stays on this computer unless you choose to share it. No personal files, passwords or screen captures are included.

What the checks found

Basic information collected

The checks collected Windows, hardware and recent event information. They can identify a recorded application crash but do not establish its underlying cause.

Checks in this report

Windows version: 10.0.22631

Windows drive free space: 420.5 GiB

Selected Windows registry flags: Windows release 24H2; update reboot flag False; servicing reboot flag False; crash-dump setting 3; automatic restart setting 1 (configuration only)

Recent Event Viewer summary (past 24 hours; latest 100 matching events per log): System: sampled 100; critical 0, error 0, warning 100; frequent source Example-Windows-Component event 10016 (100); Application: sampled 7; critical 0, error 3, warning 4; frequent source Example-Certificate-Component event 64 (3); frequent source Example_Application_Error event 1000 (2)

Hardware inventory: Collected; see the next page

What still needs attention

Wi-Fi disconnections were reported but not reproduced. Network diagnostics were not run. Note when the issue happens and review it with Lewis.

Changes made

No repair was approved or run.

What to do next

If a problem continues, note what happened and when. Review the details with Lewis before replacing parts. The inventory can identify likely models, but it cannot prove that a replacement will fit.

HARDWARE REFERENCE

Hardware at a glance

Computer: Example Computers Café Workstation - synthetic example

Motherboard: Example Components EX-B650 (revision 2.0)

Processor: Example 8-core processor

Memory: 32 GiB (2 x 16 GiB at 5600 MHz); 2/4 reported slots used

Storage 1: Example 1 TB SSD - 954 GiB (Windows interface: NVMe)

Storage 2: Example removable USB drive - capacity unavailable (Windows interface: USB)

Storage 3: Example archive drive A - 3577 GiB (Windows interface: SCSI)

Storage 4: Example archive drive B - 3577 GiB (Windows interface: SCSI)

Graphics: Example graphics card

Firmware: EX-1.4

Collected: 2026-11-01T19:45:00Z (UTC, Windows CIM)

USB capacity note: Windows returned an unusable 0 GiB inventory value for a removable drive. Capacity is unknown here; this does not show that the drive is empty or faulty.

Memory module part number(s): EX-16G-5600

Source: Windows CIM/SMBIOS, read at the collection time above. Some firmware fields may be missing or inaccurate; serial numbers are excluded.

Recent application crashes

Application Error 1000: sampled 2 in the past 24 hours (latest 20 maximum); latest two details:
2026-11-01T19:22:00Z: example.exe faulted in example.dll, exception c0000005; nearby Windows Error Reporting 1001: yes (time match only)
2026-11-01T18:14:00Z: sample.exe faulted in sample.dll, exception c000001d; nearby Windows Error Reporting 1001: no (time match only)

Before buying parts, verify power supply, case size, connectors, cooling clearance and compatibility by hand.

READ-ONLY SIGNALS

More checks and their limits

These local snapshots and bounded event samples help choose a follow-up. They do not identify a root cause by themselves. An unavailable check is not a passing result.

Service failure check

Service-control failure events in past 24 hours: 1 sampled; example service event 7031

Update history check

Local update history: latest 5 entries; failed 0, partial 0

Resource snapshot

One-time resource snapshot: CPU 42%, available memory 12.0/32.0 GiB

Storage provider check

Storage provider status: healthy 2, warning/unhealthy 0, unknown 0; not a full SMART test

Hardware event check

Targeted System events: WHEA 0, storage 0, display reset 0, PnP 219 0
